**4<sup>th</sup> December 2006**

**Ipsat Therapies commences patient recruitment in Phase IIb clinical trial using its lead product P1A**

Helsinki, 3 December 2006: Ipsat Therapies Ltd ('Ipsat') today announces that it has recruited its first patient in a Phase IIb clinical study. The study, which is multi-centre, randomized, placebo controlled and double blind, will further evaluate the safety and efficacy of P1A administered in combination with Ampicillin in preventing the damage of the residue beta-lactam antibiotic to the intestinal microflora of hospitalized patients with upper- and lower respiratory tract infections. In the previous studies performed, P1A prevented the emergence of bacterial antibiotic resistance and depletion of healthy intestinal microflora, side effects commonly associated with antibiotic treatment. An excellent safety profile was also demonstrated in all patients treated with P1A. In this study, the effect of colonization resistance disturbance to induce colonization with pathogens will be monitored.

About two million patients a year get an infection while being treated for another illness or injury and over 90 000 die because of their infections. According to the CDC (Center for Disease Control and Prevention), 1.8 million of the infections occur in hospitals, almost 100 000 occur in long-term care centres and about 340 000 occur in home health care. Only the hospital costs of treating hospital infections is estimated to exceed 35 billion USD.

The study will be carried out in 10 centres in Russia and the Ukraine. It comprised of 2 arms with 50 patients each, one receiving the beta-lactam antibiotic alone, one receiving the beta-lactam antibiotic and Ipsat P1A. Ipsat expects that the clinical treatment phase of this trial will be completed by end of May 2007.
